

## ▼ Exercises

Answer the questions or complete the tasks outlined in bold below, use the specific method described if applicable.

### ▼ What is 7 to the power of 4?

```
#Ans  
a=7**4  
a
```

```
2401
```

### ▼ Split this string:

```
s = "Hi there Sam!"
```

**into a list.**

```
#Ans  
s = "Hi there Sam!"  
s.split()  
  
['Hi', 'there', 'Sam!']
```

### ▼ Given the variables:

```
planet = "Earth"  
diameter = 12742
```

**Use .format() to print the following string:**

```
The diameter of Earth is 12742 kilometers.
```

```
#Ans  
planet = "Earth"  
diameter = 12742
```

```
print("The diameter of {} is {} kilometers.".format(planet, diameter))
```

The diameter of Earth is 12742 kilometers.

▼ **Given this nested list, use indexing to grab the word "hello"**

```
lst = [1,2,[3,4],[5,[100,200,['hello']],23,11],1,7]
```

#Ans

```
print(lst[3][1][2][0])
```

hello

▼ **Given this nest dictionary grab the word "hello". Be prepared, this will be annoying/tricky**

```
d = {'k1':[1,2,3',{'tricky':['oh','man','inception',{'target':[1,2,3,'hello']}]}]}
```

#Ans

```
print(d['k1'][3]["tricky"][3]['target'][3])
```

hello

▼ **What is the main difference between a tuple and a list?**

#Ans

```
t = (1, 2, 3)
```

```
list = [1, 2, 3, 4, 5]
```

'tuple is immutable, and list is mutable'

'tuple is immutable, and list is mutable'

▼ **Create a function that grabs the email website domain from a string in the form:**

user@domain.com

So for example, passing "[user@domain.com](#)" would return: domain.com

```
#Ans
def domainGet(email):
    print("Your domain is: " + email.split('@')[-1])

email = input("Please enter your email: >")
domainGet(email)

Please enter your email: >user@domain
Your domain is: domain
```

**Create a basic function that returns True if the word 'dog' is contained in the input**

- ▼ **string. Don't worry about edge cases like a punctuation being attached to the word dog, but do account for capitalization.**

```
#Ans
def findDog(st):
    if 'dog' in st.lower():
        print("True")
    else:
        print("False")

st = input("Please key a string: >")
findDog(st)

Please key a string: >My dog is the cutest among all dogs
True
```

**Create a function that counts the number of times the word "dog" occurs in a string.**

- ▼ **Again ignore edge cases.**

```
def countDog(s):
    count = 0
    for word in s.lower().split():
        if "dog" in word:
            count += 1
    return count
countDog("Those doggies is dodging me")
```

1

## ▼ Final Problem

**You are driving a little too fast, and a police officer stops you. Write a function to return one of 3 possible results: "No ticket", "Small ticket", or "Big Ticket". If your speed is 60 or less, the result is "No Ticket". If speed is between 61 and 80 inclusive, the result is "Small Ticket". If speed is 81 or more, the result is "Big Ticket". Unless it is your birthday (encoded as a boolean value in the parameters of the function) -- on your birthday, your speed can be 5 higher in all cases.**

#Ans

```
def caught_speeding(speed, is_birthday):
```

```
    if is_birthday:
        speeding = speed - 5
    else:
        speeding = speed
```

```
    if speeding > 80:
        return 'Big Ticket'
    elif speeding > 60:
        return 'Small Ticket'
    else:
        return 'No Ticket'
```

```
caught_speeding(66, True)
```

```
'Small Ticket'
```

```
caught_speeding(81, False)
```

```
'Big Ticket'
```

**Great job!**
